The metering jet opening is controlled by the pilot's manual mixture control. This fuel is considered "metered" fuel pressure. It is piped to a chamber in the fuel regulator inside the fuel servo. A separate line of unmetered fuel pressure is piped off before the fuel reaches the metering jet, and sent to another chamber in the fuel regulator.

Fuel under pressure from the pump enters the aircraft fuel servo which meters the fuel pressure and flow. Metered fuel from the servo travels to the fuel flow divider and then out to the fuel injectors. We overhaul, exchange, repair, and bench check aircraft fuel injection systems.

In a modern, multi-engine passenger or cargo aircraft, the fuel system is likely to consist of multiple fuel tanks which may be located in the wing or the fuselage (or both) and, in some cases, in the empennage.

systems have carbureted engines; gravity cannot create enough pressure to run an injected engine. The pump feed system is opposite to a gravity feed system in that the pump is able to provide sufficient pressure to not only move fuel to an engine that is higher than the tank, but to do so with the pressure required for a fuel-injection system.
