In our economic analysis, we distinguish two characteristics of water in terms of its economic functions and special features, i.e. water quantity as a rivalrous good, and water quality considering pollution as a non-rivalrous good. They are represented in two types of models.

Upon analysis of the uncertainty contribution by source, river water quality and quantity parameters captured most of the variability of yearly dissolved oxygen (DO) dynamics. Thus, a dedicated inference scheme was proposed to update the river parametric distributions using local flow and DO measurements.
